Threat Report | Solar Spider

JSOutProx RAT campaigns against the financial sector (APAC / MENA)

Status	Open
Type	Alert
Created	Nov 01, 2026
Sources	Resecurity, Huntress, VirusTotal, Dark Reading, Yoroi (open-source intelligence)

1. Analysis Summary

SOLAR SPIDER is a financially motivated eCrime threat actor, tracked in public reporting under that name (also referenced as TH-264 by Yoroi). It is associated with the JSOutProx remote access trojan (RAT), a modular JavaScript/.NET framework first identified in late 2019 and used in phishing campaigns against banks, money-transfer services and other financial organizations.

This report consolidates open-source intelligence. Indicators of compromise were taken from Resecurity's analysis "The New Version of JsOutProx is Attacking Financial Institutions in APAC and MENA via GitLab Abuse" (3 Apr 2024). A total of **33 indicators** were extracted: file hashes (MD5), IP addresses, domains, URLs and an email address. Supporting context comes from Huntress, Yoroi and Dark Reading, and the indicators were checked on VirusTotal.

Activity spiked around 8 Feb 2024, when a Saudi Arabia-based system integrator reported an incident targeting customers of regional banks. Victims received emails from an impersonated account carrying fake SWIFT payment notifications (enterprise customers) and MoneyGram templates (private customers). The attachments were JavaScript payloads disguised as PDF or image files (T1036 Masquerading). Payloads were hosted on GitHub from at least November 2023 and moved to GitLab in March 2024. The actor deletes a repository after delivery and creates a new one, likely to manage payloads and differentiate targets.

Attribution is not confirmed. Resecurity assesses with moderate confidence that JSOutProx may have been developed by actors from China or affiliated with them, based on the malware's sophistication, target profile and geography. Huntress notes there is no consensus that the group operates under nation-state direction, that its size, structure and leadership are unknown, and that no arrests or law enforcement operations have been announced.

Note on indicator age. The indicators were published in April 2024 and several C2 hosts were already reported offline at that time. Validate reputation and relevance against current threat intelligence platforms before blocking.

Preventive control. All validated malicious indicators must be added to the IOC Management Block List to reduce the likelihood of future exposure and to elevate the organization's security posture.

Environment search results. To be followed.

Targeted Industries
Banking, Financial Services, Money Transfer and Foreign Exchange, Government

Targeted Countries
India, Taiwan, Philippines, Laos, Singapore, Malaysia, Saudi Arabia (KSA)

Community Identifiers
SOLAR SPIDER, TH-264 (Yoroi), JSOutProx (malware)

2. Impact

The actor's goal is financial gain: stealing credentials and payment data and keeping remote control of victim machines. Documented and assessed impacts include:

- Theft of credentials and primary account numbers (PANs) from compromised users
- Fraudulent transactions and resale of stolen payment data on underground forums
- Theft of one-time passwords from the Symantec VIP application (TokensPlugin)
- Remote control of victim machines: command execution, file transfer, screen capture and keyboard/mouse control
- Financial loss and reputational damage for banks and their customers

3. Affected Products and Targets

- Windows endpoints with Windows Script Host enabled (wscript, WScript.Shell, ActiveXObject)
- Microsoft Outlook accounts and contact data
- Symantec VIP one-time-password tokens
- Banking and money-transfer customers (enterprise and private)
- Government and financial organizations in India, Taiwan, the Philippines, Laos, Singapore, Malaysia and Saudi Arabia

4. Tactics, Techniques and Procedures

- T1566.001 – Phishing: Spearphishing Attachment
- T1059.007 – Command and Scripting Interpreter: JavaScript
- T1036 – Masquerading
- T1115 – Clipboard Data
- T1071.001 – Application Layer Protocol: Web Protocols

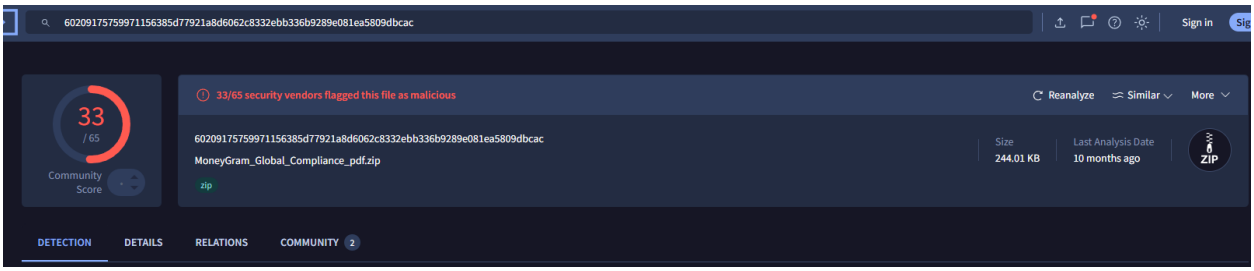

Figure 6. 9c9df8fbcef8acd1a5265be5fd8fdce9 (MoneyGram_Global_Compliance_pdf.zip): 33/65 security vendors flagged as malicious

7. Remediation

How to Defend Against Solar Spider

1. **Beef Up Email Security:** Use advanced phishing filters and sandbox attachments and URLs. A little prevention here goes a long way.
2. **Deploy Strong Endpoint Protection:** You need an EDR solution that can spot the weird stuff, like JavaScript spawning .NET processes. Hunt for JSOutProx-related behaviors and artifacts.
3. **Harden Your Tools:** Monitor and restrict the use of public code repositories like GitLab for internal work. Alert on any suspicious activity from unknown accounts.
4. **Lock Down Privileged Accounts:** Enforce multi-factor authentication (MFA) everywhere you can. Apply the principle of least privilege, especially around accounts that can access payment and financial systems.
